

How to Create a Basic Package

In general, to create a batch file package you will perform the following steps:

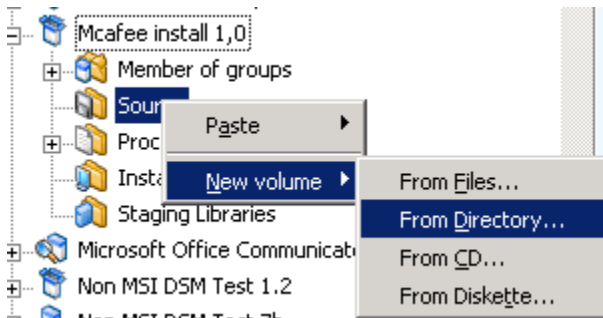

1. Expand 'Software' and then 'Software Package Library'
2. Right click on 'All Software' and select New->Software Package.

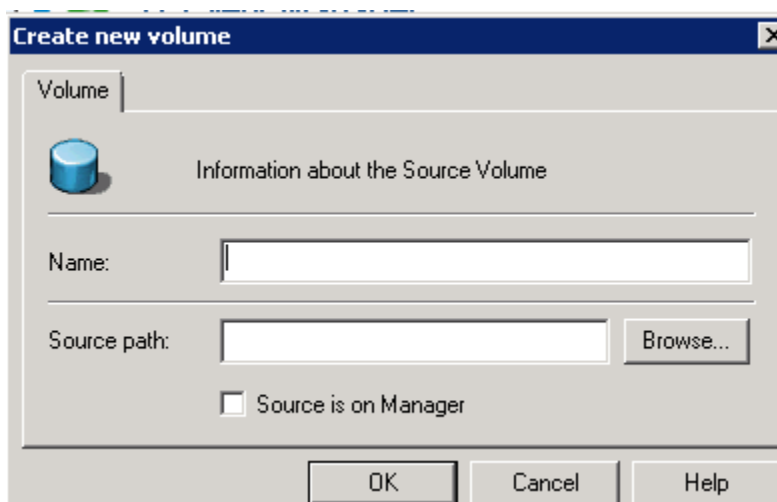

3. Assign the package a name and version, and then click OK.

4. Find the package under 'All Software' and expand it.

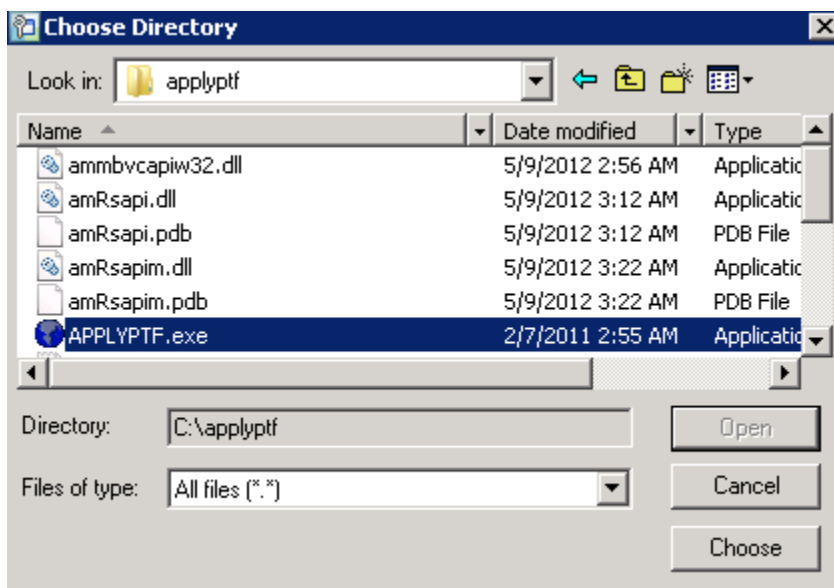

5. Click to highlight the folder called 'Source' in the ITCM console under your new package.

6. In the Name field enter Mcafee install then click on browse to the directory where you stored the Mcafee install files are stored

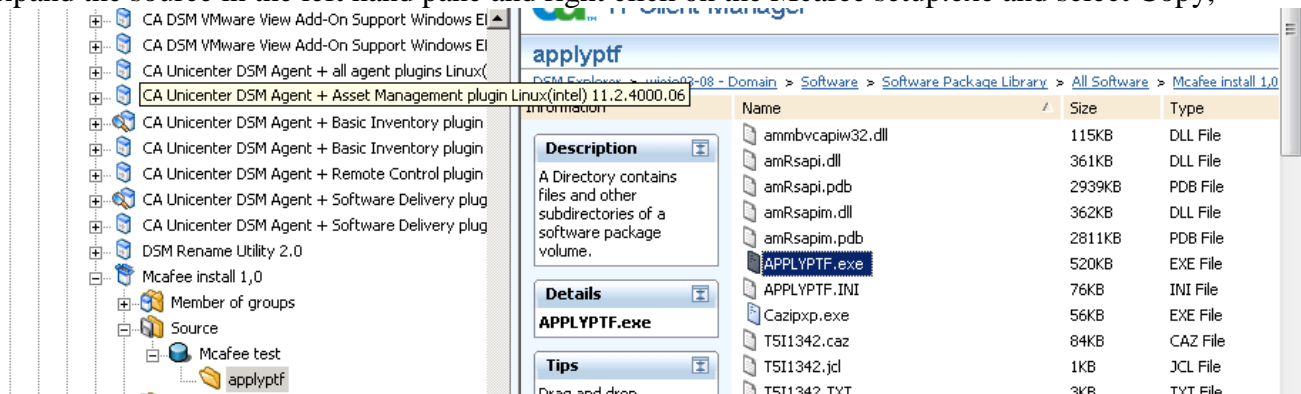

7. After highlighting the setup file for Mcafee hit the choose button in my test I used applyptf

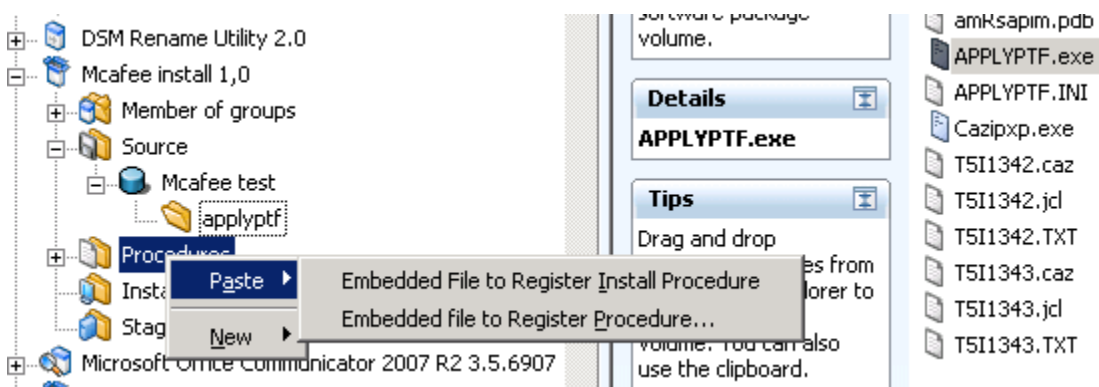

8. Click ok

9. Expand the source in the left hand pane and right click on the McAfee setup.exe and select Copy,

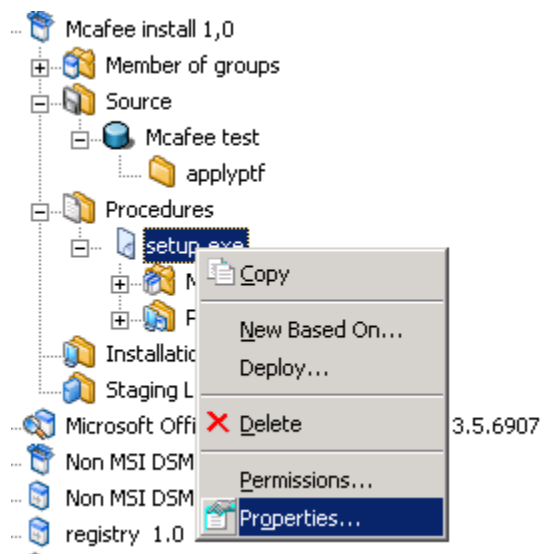

10. Now right click on Procedure under you package in the left hand pane and select Paste and embedded file to register install procedure

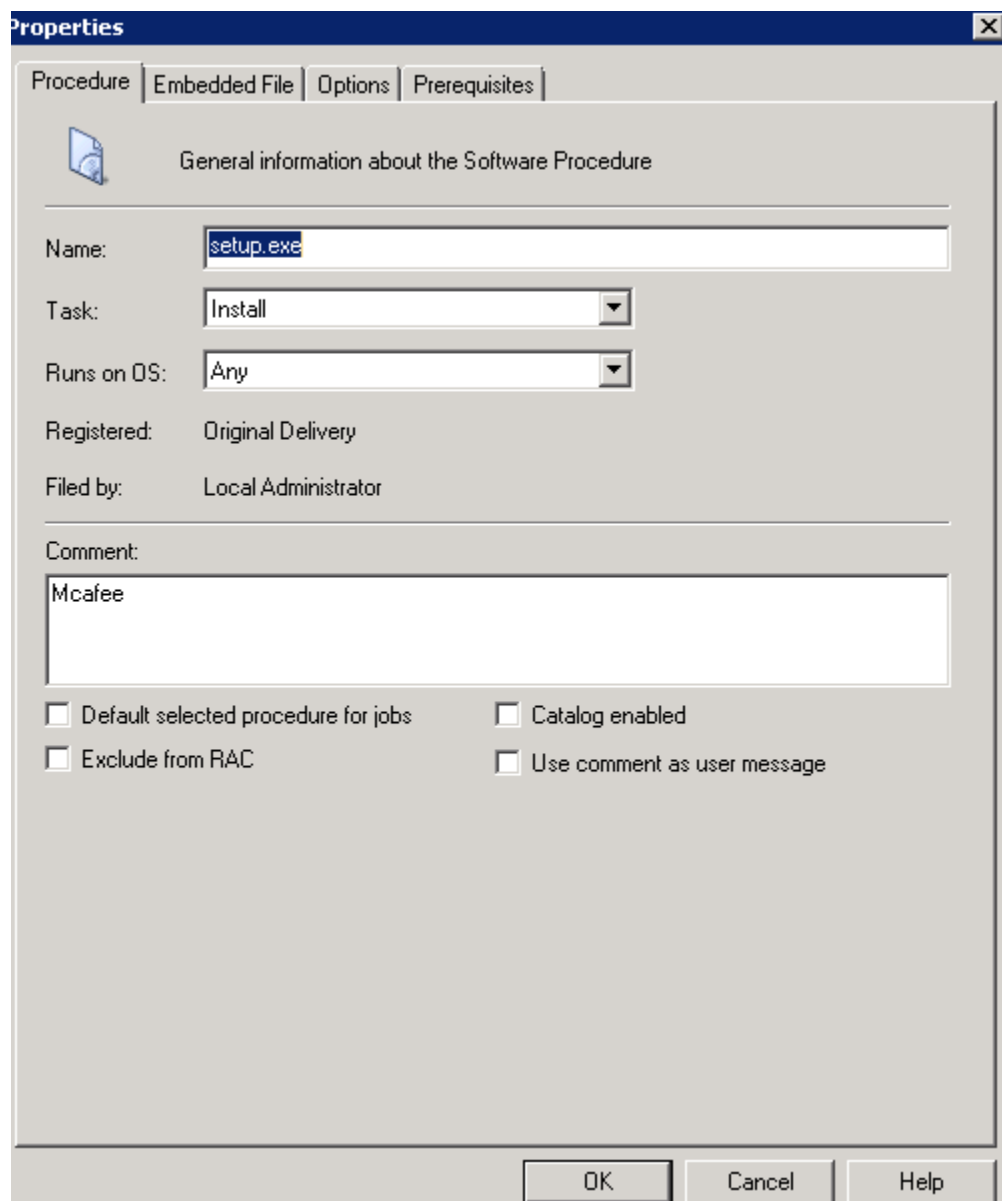

11. IF you need to add any setup.exe switches or parameters you can do the following:

Expand procedures and then expand down to the setup.exe file and right click and select properties

If not seal the package and you are ok to deploy the package.

12. This brings up the properties box

13. If you want you can add optional comments in that field , don't change anything else
14. Select the embedded file tab

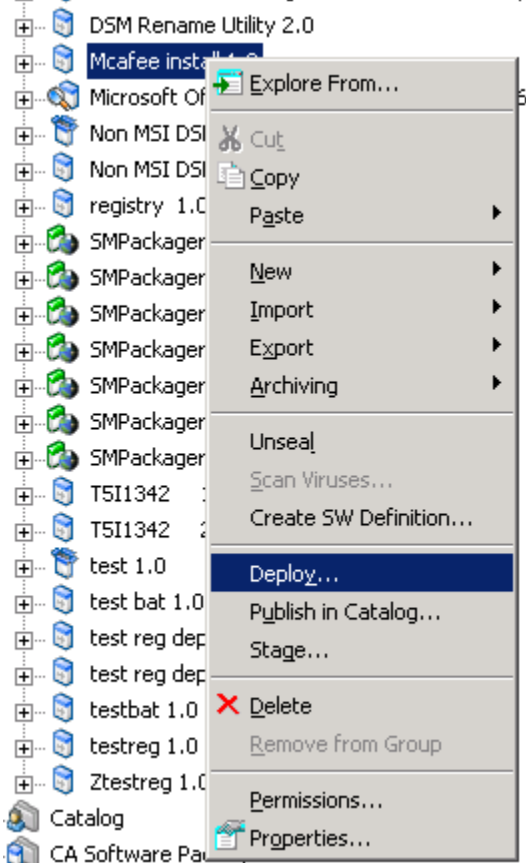

The screenshot shows a Windows-style 'Properties' dialog box with a dark blue title bar. It has four tabs: 'Procedure', 'Embedded File', 'Options', and 'Prerequisites'. The 'Embedded File' tab is selected. Inside the dialog, there is a yellow notepad icon and the text 'Detailed information about the Software Procedure'. Below this, there are four labeled text boxes: 'File:' containing 'setup.exe', 'Subpath:' containing 'applyptf', 'Volume:' containing 'Mcafee test' (with a dropdown arrow), and 'Type:' containing 'Executable file' (with a dropdown arrow). Below these is a large empty text box labeled 'Parameters:' with a '>' button to its right. At the bottom of the dialog are three buttons: 'OK', 'Cancel', and 'Help'.

15. In the parameters section you can add any switches or parameters you need to. See the software delivery administration guide located on the ITCM 12.5 dvd under the DOC subdirectory for more details.

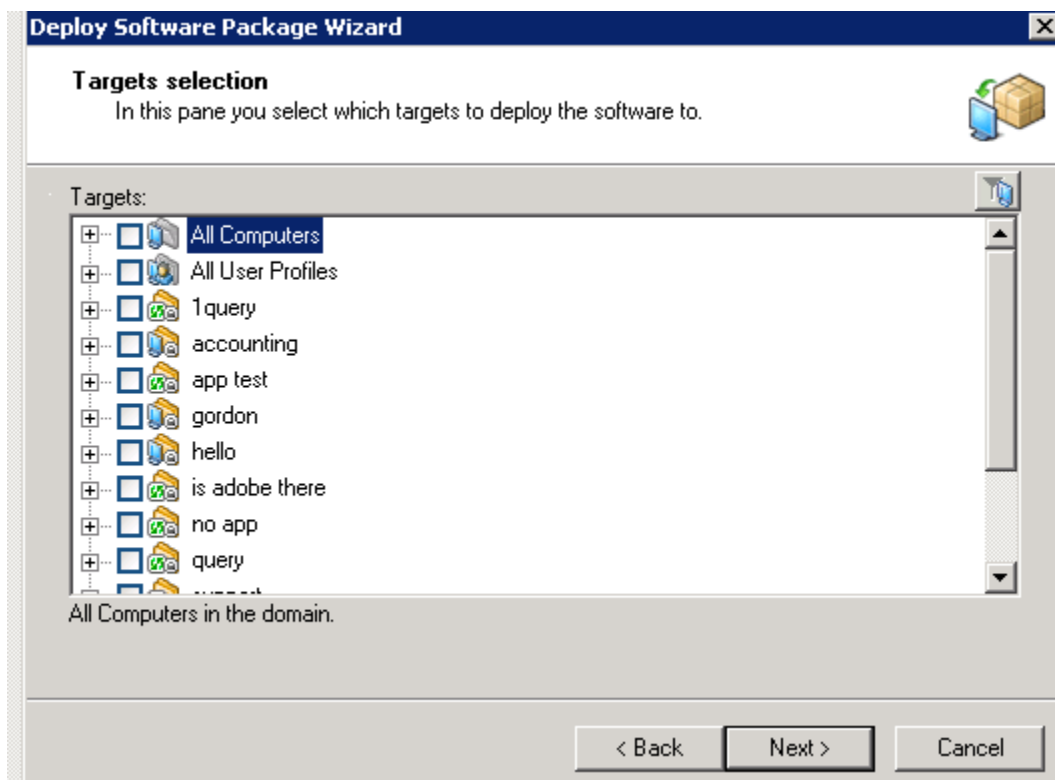

16. Click ok
17. Right click on the package name in the left hand pane and select Seal.

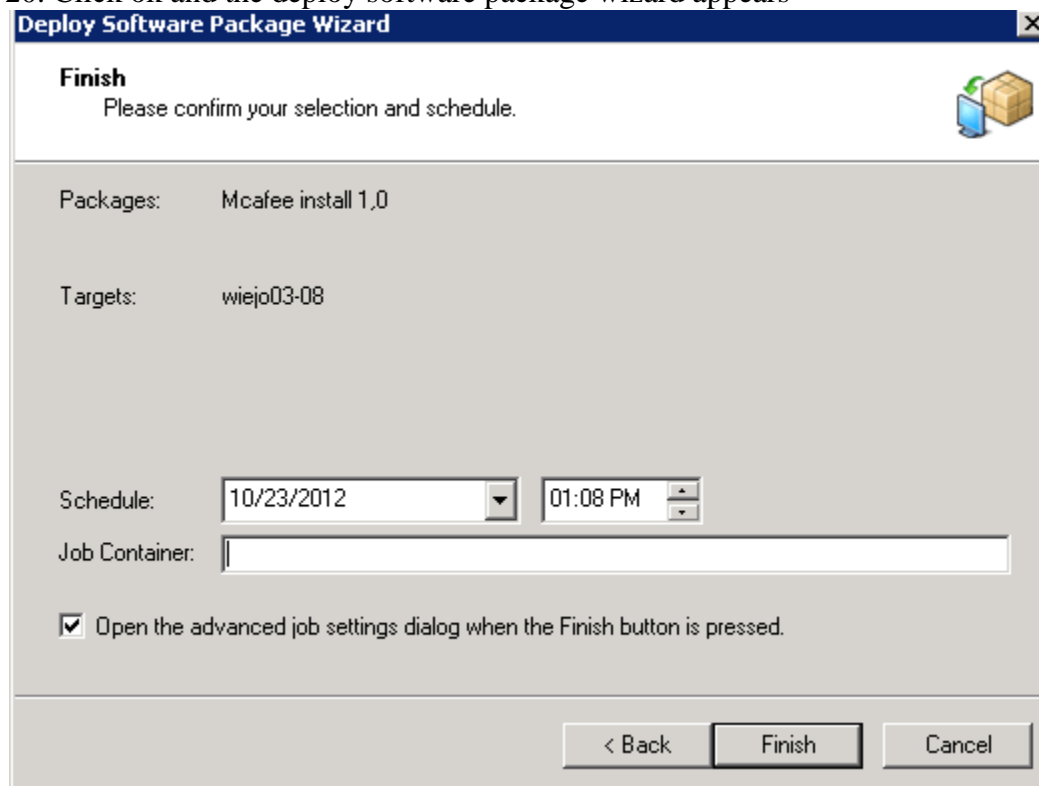

18. To deploy this package just browse in the left hand pane and right click and select deploy

19. The deployment wizard will come up and on the target selection screen choose the computer or group you want to deploy McAfee to

20. Click ok and the deploy software package wizard appears

21. click finish

22. Click yes at the error that you didn't select a job container

23. Click ok and the job will be submitted
